

Can you give me the codes to create a game that makes you choose the opposite of your answer in Python?

**ChatGPT said:**

ChatGPT

Certainly! I can help you create a game in Python where the player is prompted to answer questions, but the objective is to choose the opposite of what they initially intend. This game will play on the idea of tricking your brain into answering the opposite of your true thoughts.

Here's a simple implementation of the "Opposite Answer" game in Python:

python

Copy code

```
import random
```

```
def ask_question(question, correct_answer):
    """
    Ask a question and make the player choose the opposite of their
    answer.
    """
    print(question)
    print("Choices:")
    print("1. Yes")
    print("2. No")

    player_choice = input("Choose 1 for Yes or 2 for No: ")

    # Validate the input to be 1 or 2
    while player_choice not in ["1", "2"]:
        player_choice = input("Invalid choice! Choose 1 for Yes or 2
for No: ")

    # Convert player choice to the actual response
    if player_choice == "1":
        player_answer = "Yes"
    else:
        player_answer = "No"

    # Determine if the player's answer is opposite to the correct one
    if player_answer == correct_answer:
```

```

        print(f"Oops! You were supposed to choose the opposite!
Correct answer: {correct_answer}\n")
        return False
    else:
        print(f"Great job! You chose the opposite answer. Correct
answer: {correct_answer}\n")
        return True

def main():
    print("Welcome to the 'Opposite Answer' game!")
    print("In this game, you must always choose the opposite of your
true answer.\n")

    # List of questions and their correct answers (what they should
have answered)
    questions = [
        ("Do you like ice cream?", "No"),
        ("Do you enjoy coding?", "No"),
        ("Is the sky blue?", "No"),
        ("Do you think Python is easy?", "No")
    ]

    score = 0
    random.shuffle(questions) # Shuffle questions for randomness

    for question, correct_answer in questions:
        if ask_question(question, correct_answer):
            score += 1

    print(f"\nYour final score: {score}/{len(questions)}")
    print("Thanks for playing!")

if __name__ == "__main__":
    main()

```

**How it works:**

1. **Question Format:** Each question comes with a "correct" answer that the player must answer oppositely.
2. **Player Input:** The player is asked to choose between "Yes" or "No" for each question.
3. **Opposite Response:** The goal is for the player to always choose the opposite of the intended answer.
4. **Score Tracking:** If the player answers oppositely, they get a point. At the end of the game, their score is shown.

## Game Flow:

- The game asks the player to choose "1" for Yes or "2" for No.
- It checks if the player's answer is the opposite of the "correct" answer (which is predefined).
- The player's score is updated accordingly, and the game concludes by showing the total score.

## Example Output:

yaml

Copy code

Welcome to the 'Opposite Answer' game!

In this game, you must always choose the opposite of your true answer.

Do you think Python is easy?

Choices:

1. Yes

2. No

Choose 1 for Yes or 2 for No: 1

Great job! You chose the opposite answer. Correct answer: No

Is the sky blue?

Choices:

1. Yes

2. No

Choose 1 for Yes or 2 for No: 2

Oops! You were supposed to choose the opposite! Correct answer: No

Your final score: 1/4

Thanks for playing!

## Customization:

- You can easily add more questions to the `questions` list.
- The game uses randomization to shuffle the questions every time it's run.

Feel free to modify and extend the game as you see fit!
